

Self-initiated demo by Flow Lab · the app is real and live, the business behind it (Bramblewash Mobile Grooming) is invented · no client data involved

SAMPLE REPORT · LOVABLE APP CHECK

What a stranger could do with your Lovable app — checked in one day

We built a booking app in Lovable for a fictional mobile dog groomer, published it, and then checked it the way we check a client's app: first from the outside, with nothing but the public link, then by walking through every main flow on a phone. This is the report, with every finding fixed and checked again.

1 critical

anyone could take over the owner account

5 to fix

flows that lose bookings or mislead customers

0 rows

readable by visitors in 15 tables

All fixed

and retested on the live app

What was checked

- **From the outside, with only the public link.** The same keys any visitor's browser receives: which database tables answer without a login and how many rows they show, whether sign-up is open, whether files are public, whether a secret key sits in the page code. Read-only — no data is changed, no values are copied.
- **By hand, on a 390 px phone.** The main flows a real customer and owner use: booking, rescheduling, late cancel, waitlist, reminders, owner dashboard.
- **Not included in this tier:** reading the source code and database rules line by line. That is the full review (see the [Walkwren sample](#)).

Summary

#	FINDING	RISK	STATUS
1	Anyone could create the owner account and see every customer	Critical	Fixed
2	A freed slot was offered to someone whose visit didn't fit — and told "someone was faster"	Lost revenue	Fixed
3	One person got several "you didn't finish booking" messages	Spam risk	Fixed
4	The main "Book" button needed two taps	Lost bookings	Fixed
5	Links inside messages were relative ("/book?zip=...")	Dead links	Fixed
6	Screens said messages were "sent" when they were only queued	Trust	Fixed
7	Error on first load of the owner page (hydration #418)	Minor	Fixed
—	Tables readable without login · secret keys in page code · public file storage	None found	—

Findings

Critical

1. Anyone could become the owner

Found	The public sign-in page offered “First time? Create the owner account”, and the dashboard had a one-time “Make me the owner” button. Sign-up was open to everyone. The owner account had not been created yet, so the first stranger to sign up would have taken the role.
Risk	Full access to every customer’s name, phone number and home address, the schedule and the message history — and the real owner locked out.
Fix	The public path to the owner role was removed, sign-ups were switched off, and the role can now be granted only from the backend.
Retest	The sign-in page only signs people in; the auth settings report sign-up disabled.

Lost revenue

2. The waitlist refill failed silently

Found	After a cancellation the app offered the free 45-minute slot to a waitlisted client whose dog needs 100 minutes. Their "Take it" failed against the next visit, and the page said "Already taken — someone was a little faster". Nobody had taken it.
Risk	The one feature meant to refill empty slots left them empty, and told the customer something untrue.
Fix	Offers now go only to people whose own visit fits the gap (area day, travel time, closing time); the offer shows their own service and length; failures show the real reason.
Retest	Cancel → offer to a client whose visit fits → "Take it" → "It's yours!", and the visit appears in the owner's week.

Spam risk

3. Duplicate follow-ups

Found	Every started booking created a new lead, so one phone number that started twice got several "Still want that groom?" messages.
Risk	Annoyed customers, and SMS/email providers flag senders who repeat messages.
Fix	Leads are merged by phone and email; at most one follow-up per contact per 7 days, never after a finished booking.
Retest	Running the automation twice sends nothing twice.

Lost bookings

4. "Book a groom" needed two taps

Found	The first tap only checked the ZIP code; nothing moved, so a customer on a phone would think it was broken.
Fix / retest	One tap checks the ZIP and opens the next step.

5–6. Message texts

Found	Links inside messages were relative (they don't work in an email or SMS), and screens said "sent" while messages were only queued in the Outbox.
Fix / retest	Full links to the live site; the wording is now "handled" / "ready to send", with a note that real sending plugs in with the business's own email domain.

Minor

7. Owner page error on first load

Found	The server rendered only the footer of the owner page while the browser drew the sign-in form, which triggers React error #418 in the console.
Fix / retest	Server and browser now draw the same first screen; no console errors on a clean load.

The outside check, as it ran

Read-only requests with the public key every visitor's browser already has. Values are never printed — only whether a table answers and how many rows it shows.

What you get for your app

- The same report for your live app within 1 working day: every finding with what we saw, what it risks and how to fix it.
- Fixes that are yours to apply — or we apply them in a follow-up and check again.
- Only with your written permission, only read-only from the outside, nothing copied.
